

Climate changes

By the term climate change, we mean changes in temperatures occurring all over the world. For our planet, these changes are nothing new, they were triggered by natural processes. However, thanks to humans, global warming has picked up a very fast pace.

Task No.1

What do you think climate change is?

What are the main factors influencing the climate of our planet?

Think and write how you influence the Earth's climate:

Positive:

Negative:

Task No.2:

Climate change significantly affects the state of ecosystems. Marine ecosystems are relatively far from our land, but do you know that they are of great importance for all living things on our planet? Maybe the word PHYTOPLANKTON will help you. Try to use the Internet to find why it is so important.

Task No.3:

Name the causes of climate change and global warming shown in the following pictures.
